Brief Summary

A Two-Minute Executive Overview

PART 3 — BRIEF SUMMARY

Executive Overview

Future of Jobs in India: 3.0 — Navigating Skills in the Digital Age is a FICCI–EY study (September 2024) that examines how AI, Digital Public Infrastructure (DPI), climate action, workforce mobility and Industry 4.0 are reshaping jobs and skills across five key Indian sectors: **Manufacturing, Healthcare, Infrastructure, Energy and FMCG**. It is the third in a report series that began in 2017, and combines secondary research with primary interviews and a digital survey of over 200 industry leaders, learners, trainers, academicians and policymakers.

India's demographic profile — a median age of 28.1 and over 371 million youth — gives it a rare window to convert scale into a genuine demographic dividend, provided skilling keeps pace with a rapidly digitising, climate-conscious economy.

Main Objectives

- ✓ Map macroeconomic trends, employment data and international benchmarks across five sectors.
- ✓ Assess the combined impact of AI, DPI, Climate/Green Jobs, Workforce Mobility and Industry 4.0.
- ✓ Capture the views of Employers, Learners and Trainers through structured surveys and interviews.
- ✓ Identify emerging job roles and priority skill sets for the next 2–3 years.
- ✓ Recommend concrete actions for industry, skilling institutions and government.

Key Features

-  A 5 Sectors × 5 Lenses × 3 Personas research framework for structured comparability.
-  Sector deep-dives with government schemes, FDI data and growth projections.
-  A dedicated playbook on Digital Public Infrastructure — registries, digital credentials, skilling passports and AI knowledge assistants.
-  A Harvey-ball readiness matrix scoring every sector and stakeholder against all five lenses.

 Working Process / Methodology

1. **Secondary Research** — Comprehensive review of government data (Union Budget, MSDE, PLFS, Economic Survey), global indices and prior FICCI–EY reports.
2. **Primary Research** — Structured and unstructured interviews plus a digital survey reaching over 200 senior leaders, learners, trainers and policymakers across the five sectors.
3. **Analysis Against 5 Lenses** — Each sector and persona is scored against AI, DPI, Climate, Workforce Mobility and Industry 4.0 to surface impact patterns.
4. **Validation** — Findings and recommendations validated by industry leaders before finalisation.

 Technologies & Themes Covered

AI / GENERATIVE AI	DPI / DPG	INDUSTRY 4.0	GREEN TECH & ESG	WORKFORCE MOBILITY
-----------------------	-----------	--------------	---------------------	-----------------------

These themes are examined not as abstract trends but through their direct effect on job creation, job transformation and the reskilling burden they place on India's training ecosystem — including flagship platforms like the Skill India Digital Hub (SIDH) and schemes such as PMKVY 4.0, PM Vishwakarma and the National Apprenticeship Promotion Scheme.

 Expected Benefits

-  A clearer, shared picture of which roles and skills will matter most in the near term.
-  Stronger industry–academia alignment through curriculum and apprenticeship recommendations.
-  Faster, more informed policy action on ITI modernisation and skilling infrastructure.
-  A practical reference for individuals planning reskilling or career transitions.

⊕ Future Scope

The report points toward several directions for continued work: deeper build-out of Digital Public Infrastructure components (centralized skills registries, portable digital credentials, skills equivalency for international mobility, and AI knowledge assistants); expansion of green-job pipelines as India targets 500 GW of non-fossil energy capacity by 2030; and a stronger, formalised framework for industry–academia linkages that can be scaled nationally across ITIs and skilling institutions.

Future editions of this series are well positioned to track how quickly these recommendations translate into measurable gains in employability, women's labour-force participation, and the pace of AI/Gen-AI adoption across each of the five sectors.

✓ Conclusion

India's skilling and employment ecosystem stands at a genuine inflection point. AI and Generative AI are creating optimism about job creation even as they demand urgent reskilling; Digital Public Infrastructure offers a uniquely Indian route to scale that reskilling affordably; and climate commitments are opening an entirely new category of green jobs. The report's central message is that the time has come to **reimagine career paths, invest in lifelong learning, and build an inclusive, adaptive workforce** — through sustained collaboration between government, industry and the skilling ecosystem.
